

CLAIMS

1. An access right setting apparatus which can set  
access right information for limiting utilization of a resource with  
5 respect to said resource whose utilization can be limited by setting  
an access right, characterized by:

- access request information acceptance means for  
accepting access request information in which information for  
requiring the access right setting to said resource is described;
- 10 access request information judgment means for judging a  
content of said access request information accepted by said  
access request information acceptance means; and
- 15 access request information setting means for setting the  
content of said access request information judged by said access  
request information judgment means as said access right  
information.

2. An access right setting apparatus which can set  
access right information for limiting utilization of a resource with  
20 respect to said resource whose utilization can be limited by setting  
an access right, characterized by:

- access request information acquirement asking means  
for asking for acquirement of access request information in which  
information for requiring the access right setting to said resource  
25 is described;

access request information acceptance means for acquiring said access request information designated by said access request information acquirement asking means;

access request information judgment means for judging 5 enable/disable of a content of said access request information acquired by said access request information acceptance means; and

access request information setting means for setting the 10 content of said access request information judged by said access request information judgment means as said access right information.

3. A manager terminal connected to an access right setting apparatus which can set access right information for 15 limiting utilization of a resource with respect to said resource whose utilization can be limited by setting an access right via a network, characterized by:

access request information acceptance means for accepting access request information in which information for 20 requiring the access right setting to said resource is described;

access request information judgment means for judging a content of said access request information accepted by said access request information acceptance means; and

access request information setting means for setting the 25 content of said access request information judged by said access

request information judgment means as said access right  
information, said manager terminal comprising:

access request information acquirement asking means  
for asking for acquirement of the access request information in  
5 which the information for requiring the access right setting to said  
resource is described;

access request information judgment means for receiving  
said access request information from said access right setting  
apparatus, and judging enable/disable of the content of said  
10 access request information; and

access request information automatic judgment means  
for automatically performing the enable/disable judgment.

4. A manager terminal connected to an access right  
15 setting apparatus which can set access right information for  
limiting utilization of a resource with respect to said resource  
whose utilization can be limited by setting an access right via a  
network, characterized by:

access request information acquirement asking means  
20 for asking for acquirement of access request information in which  
information for requiring the access right setting to said resource  
is described;

access request information acceptance means for  
acquiring said access request information designated by said  
25 access request information acquirement asking means;

access request information judgment means for judging enable/disable of a content of said access request information acquired by said access request information acceptance means; and

5 access request information setting means for setting the content of said access request information judged by said access request information judgment means as said access right information, said manager terminal comprising:

10 access request information acquirement asking means for asking for acquirement of the access request information in which the information for requiring the access right setting to said resource is described;

15 access request information judgment means for receiving said access request information from said access right setting apparatus, and judging enable/disable of the content of said access request information; and

access request information automatic judgment means for automatically performing the enable/disable judgment.

20 5. The access right setting apparatus according to claim 1 or 2, characterized by user identifier registration means for issuing an identifier for uniquely specifying a user, necessary for performing user authentication to make possible connection for the user who cannot connect to said access right setting apparatus for 25 accessing said resource, and registering the identifier as a part of

said access request information.

6. The access right setting apparatus according to any  
one of claims 1, 2, and 5, characterized by access request  
5 information acceptance means which can accept said access  
request information designated by an identifier of classification of  
said resource, not by an identifier for uniquely specifying said  
resource with respect to designation of said resource as an object  
of the access right setting described in said access request  
10 information.

7. The manager terminal according to claim 3 or 4,  
characterized by access object resource selection means by  
which a manager can select said resource as an object of  
utilization from a plurality of resources, when said resource as an  
15 object of the access right setting described in said access request  
information is designated not by an identifier for uniquely  
specifying said resource, but by an identifier of classification of  
said resource with respect to designation of said resource as the  
object of the access right setting described in said access request  
20 information, and when there are a plurality of corresponding said  
resources.

8. The manager terminal according to any one of claims  
25 3, 4 and 7, characterized by access request information change

means which can change the content described in said access request information received from said access right setting apparatus.

- 5           9. The access right setting apparatus according to any one of claims 1, 2, 5 and 6, characterized by an open resource information storage device which can store information open to an access originator of said resource among information of not an identifier for uniquely specifying said resource, but an identifier of classification of said resource with respect to designation of said resource as the object of the access right setting described in said access request information.
- 10          10. The access right setting apparatus according to any one of claims 1, 2, 5, 6 and 9, characterized by display information preparation means which can convert the content described in said access request information to a visually and easily understandable natural language in order to accurately notify said manager of said access request information.
- 15          20         11. The access right setting apparatus according to any one of claims 1, 2, 5, 6, 9 and 10, characterized by access request information authentication means for authenticating said access request information in order to confirm that said access request information is not prepared by an illicit action represented by

falsification or pretense.

12. The access right setting apparatus according to any one of claims 1, 2, 5, 6, 9, 10 and 11, characterized by:

- 5 request information transfer means for a mobile terminal for transferring the content described in said access request information to a mobile terminal so that the content is grasped in a remote area; and
- 10 request information judgment means for the mobile terminal for performing the enable/disable judgment of said access request information from said mobile terminal.

13. The access right setting apparatus according to claim 12, characterized by object resource selection means for the mobile terminal for performing selection of the resource as said access object performed by the access object resource selection means by which said manager can select said resource as the object of the utilization from said plurality of resources from said mobile terminal, when said resource as the object of the access right setting described in said access request information is designated not by an identifier for uniquely specifying said resource, but by an identifier of classification of said resource with respect to designation of said resource as the object of the access right setting described in said access request information, and
- 25 when there are a plurality of corresponding said resources.

14. The access right setting apparatus according to  
claim 12 or 13, characterized by request information change  
means for the mobile terminal for performing the change of the  
content described in said access request information from said  
mobile terminal.
